A First Course in Noncommutative Rings  
T. Y. Lam (auth.) One of my favorite graduate courses at Berkeley is Math 251, a one-semester course in ring theory offered to second-year level graduate students. I taught this course in the Fall of 1983, and more recently in the Spring of 1990, both times focusing on the theory of noncommutative rings.

The Wedderburn-Artin theory has since become the cornerstone of noncommutative ring theory, so in this first chapter of our book it is only fitting that we devote ourselves to an exposition of this basic theory. One is motivated to read on and armed with two important insights.

Prime ideals for commutative rings. An ideal  $P$  of a commutative ring  $R$  is prime if it has the following two properties: . If  $a$  and  $b$  are two elements of  $R$  such that their product  $ab$  is an element of  $P$ , then  $a$  is in  $P$  or  $b$  is in  $P$ ;;  $P$  is not the whole ring  $R$ .; This generalizes the following property of prime numbers: if  $p$  is a prime number and if  $p$  divides a product  $ab$  of two integers, then  $p$  ...

Commutative rings. The nilradical of a commutative ring is the set of all nilpotent elements in the ring, or equivalently the radical of the zero ideal. This is an ideal because the sum of any two nilpotent elements is nilpotent (by
