ASTM E74-13a section 3.1.3 defines a secondary force standard as an instrument or mechanism, the calibration of which has been established by comparison with primary force standards. To use a secondary force standard to perform a calibration in accordance with ASTM E74-13a, the secondary force standard must be calibrated by comparison with primary force standards. 49 50. ASTM E74-13a addressed this issue by changing the term uncertainty to LLF. The LLF is calculated in accordance with section 8 Calculation and Analysis of Data found in ASTM E74-13a and is a Type A uncertainty component. Morehouse has developed a guidance document to help you calculate your

Per Section 8.6 of ASTM E74-13a: “The loading range shall not include forces outside the range of forces applied during the calibration. Per Section 7.2.1: “If the lower limit of the loading range of the device (see 8.6.1) is anticipated to be less than one-tenth of the maximum force applied during calibration, then forces should be applied at or below this lower limit.”

ASTM E74-13a is titled Standard Practice of Calibration of Force-Measuring Instruments for Verifying the Force Indication of Testing Machines ISO 376:2011 Metallic materials — Calibration of force-proving instruments used for the verification of uniaxial testing machines.

ASTM E74 IS NOT THE SAME AS ISO 376

4.1 Testing machines that apply and indicate force are in general use in many industries. Practices E4 has been written to provide a practice for the force verification of these machines. A necessary element in Practices E4 is the use of force-measuring instruments whose force characteristics are known to be traceable to the SI. Practices E74 describes how these force-measuring instruments are ...
