Closed Ended Questionnaire Data Analysis

Abstract. A KeyGraph-like algorithm, which incorporates the concept of structural importance with association rules mining, for analyzing closed-ended questionnaire data is presented in this paper. The proposed algorithm transforms the questionnaire data into a directed graph, and then applies association rules mining and clustering procedures, whose parameters are determined by gradient sensitivity analysis, as well as correlation analysis in turn to the graph.

Analysis gets a bit more complicated if you're creating surveys with open-ended questions. Analyzing this sort of data is called qualitative data analysis or QDA for short. It's usually a cumbersome process involving some combination of clunky analysis software, sticky notes, spreadsheets, Microsoft Word, and lots of coffee.

Survey Analysis in 2020: How to Analyze Results [3 Examples]

Closed-ended questions are often good for surveys, because you get higher response rates when users don't have to type so much. Also, answers to closed-ended questions can easily be analyzed statistically, which is what you usually want to do with survey data.

1) Group your data: you will almost certainly find categories that should be grouped but ended up in different categories because respondents used different words to describe the same concept. In our sample data, we found the terms 'Lead Gen' and 'Form Submissions,' and these belong in the same category. Drag these columns next to each other, and apply a color (any color) to the group of ...
