Aerodynamics has seen many developments due to the growth of scientific computing, which has caused the design cycle time of aerospace vehicles to be heavily reduced. Today computational aerodynamics appears in the preliminary step of a new design, relegating costly, time-consuming wind tunnel testing to the final stages of design.

Aerodynamics involves the study of local pressures generated over the vehicle while in flight and the resultant integrated forces and moments that, when coupled with forces such as gravity and engine thrust, determine how a spacecraft will fly. Aerothermodynamics focuses on heating to the spacecraft's surface during flight. This information is used

Introduction to hypersonic vehicle design from a historical perspective, hypersonic flight vehicle programs in the US are traced from the early 60's to current active programs. Design Challenges. Major hypersonic vehicle design and performance challenges will be reviewed, such as: large variations in aerodynamic and propulsion response with Mach number; extreme thermal environments that drive material options, structural concepts and thermal protection/management, configuration impacts of ...

Hypersonic Flight Vehicle Design and Performance Analysis ...

Flight dynamics characterizes the motion of a flight vehicle in the atmosphere. As such, it can be considered a branch of systems dynamics in which the system studies is a flight vehicle. The response of the vehicle to aerodynamic, propulsive, and gravitational forces, and to control inputs from the

Introduction to Aircraft Stability and Control Course ...

Description. Flight Vehicle Performance and Aerodynamic Control is designed to serve as a text for either an 11-week or a 16-week course at the sophomore level. It explains typical methods used to estimate aircraft performance, the theoretical basis of these methods, and how various parameters derived from the aircraft geometry can be used to estimate the requirements of control surfaces and the aerodynamic forces required to actuate these surfaces.

"Flight Vehicle Aerodynamics" captures his latest efforts to move from 2D vortex panel method to 3D vortex lattice method in the AVL code. By considering aircraft performance during various manoeuvres this approach is absolutely relevant to aircraft optimisation - even in a world where freeware CFD codes such as Open Foam make serious aerodynamic investigation available to projects on a limited budget.

Flight efficiency is significantly inferior to previous estimates [10,12], and somewhat lower than some extant soaring birds [37–40]. However, owing to the low flight speed, the minimum sink rate (approx. 1.0 m s^{−1}) was comparable to extant birds [32,37–40] and bats . As wing bone size increases (relative to the wing chord), the sink ...
