### The Circumpolar Constellations And The

All circumpolar constellations are found near the celestial poles and, due to their proximity to the poles, they never disappear from view. The five northern constellations visible from most locations north of the equator throughout the year are Cassiopeia, Cepheus, Draco, Ursa Major, and Ursa Minor.

### Circumpolar constellations - Constellation Guide

In astronomy, a circumpolar constellation is a constellation (group of stars) that never sets below the horizon, as viewed from a location on Earth. Due to Earth's rotation and axial tilt with respect to the Sun, the stars and constellations can be divided into two categories. Those stars and constellations that never rise or set are called circumpolar.
