A synthesis reaction or direct combination reaction is a type of chemical reaction in which two or more simple substances combine to form a more complex product. The reactants may be elements or compounds, while the product is always a compound. General Form of Synthesis Reactions The general form of a synthesis reaction is:

Synthesis Reaction Description Plus Examples

A synthesis reaction or direct combination reaction is one of the most common types of chemical reaction. In a synthesis reaction, two or more chemical species combine to form a more complex product: $A + B \rightarrow AB$. In this form, a synthesis reaction is easy to recognize because you have more reactants than products.

The ultraviolet radiation in sunlight has both positive and negative health effects, as it is both a principal source of vitamin D 3 and a mutagen. A dietary supplement can supply vitamin D without this mutagenic effect. Vitamin D has been suggested as having a wide range of positive health effects, which include strengthening bones and possibly inhibiting the growth of some cancers.
